

| 1. | Process Number | Instruction           | x-value                      |
|----|----------------|-----------------------|------------------------------|
|    | P1             | x = x - 1;            | 9                            |
|    | P1             | x = x + 1;            | 10                           |
|    | P2             | x = x - 1;            | 9                            |
|    | P1             | if (x != 10)          | 9                            |
|    | P2             | x = x + 1;            | 10                           |
|    | P1             | printf("x is %d", x); | 10 → Final Output: "x is 10" |

| 2 | Process Number | Instruction           | x-value  | Register for P1 | Register for P2 |
|---|----------------|-----------------------|----------|-----------------|-----------------|
|   | P1             | LD R0, X              | 10       | 10              |                 |
|   | P1             | DECR R0               | 10       | 9               |                 |
|   | P1             | STO R0, X             | 9        | 9               |                 |
|   | P2             | LD R0, X              | 9        | 9               | 9               |
|   | P2             | DECR R0               | 9        | 9               | 8               |

|   | P1             | printf("x is %d", x); | "x is 8" |                 |                 |

3. Binary Semaphores can only be 1 if not busy, or 0 if busy. General semaphores can only hold any positive integers.
4. A monitor is a software module consisting of one or more procedures, an initialization sequence, and local data
5. Operations include initializing a positive integer value, semWait (decrements the semaphore value and blocks process that executes semWait when a value becomes negative), and semSignal (increments a semaphore value and blocks the performance of semWait if the output is less than or equal to zero)
